## FAIL-SAFE SYSTEM

### MAIN FEATURES

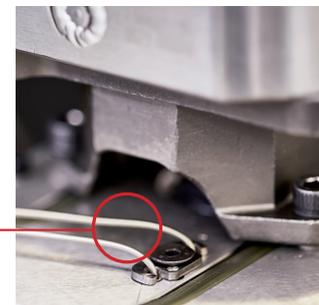

- Double heaters and double thermocouples mounted on the manifolds and nozzles allow normal production to continue, even in the event of a fault, preventing downtime and financial losses.
- Systems fitted with "Fail-Safe No-Stop System" already have backup heaters and thermocouples in place, therefore, you do not need any further spare parts.
- In the event of a faulty thermocouple, it's possible for the backup thermocouple to make a comparison with the faulty one in order to determine the correct temperature, therefore preventing production stoppages and ensuring optimal part quality.
- It's also possible to connect in parallel the double heaters and in case of failure the operational one restore the necessary power.
- Compliance to ISO 9000 quality certification.

Double heaters

Double thermocouples

Fail Safe not available for U.S. and CANADIAN market
